

RF12 programming guide

1. Brief description

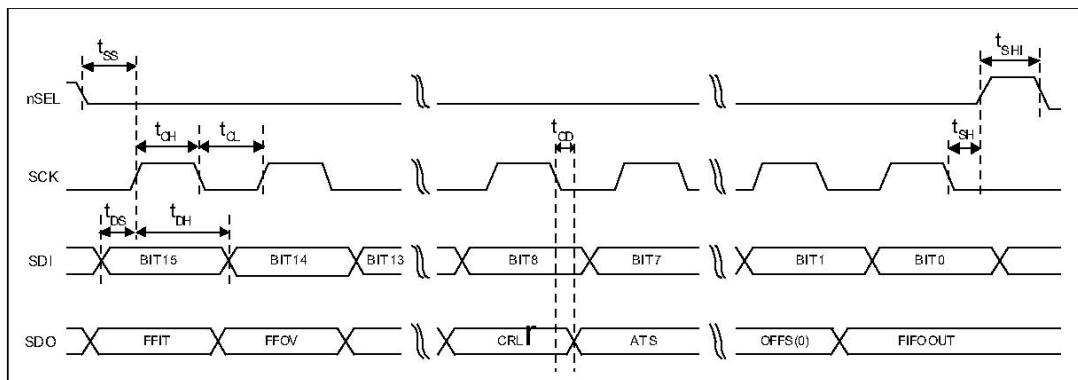

RF12 is a low cost FSK transceiver IC witch integrated all RF functions in a single chip. It only need a MCU, a crystal, a decouple capacitor and antenna to build a hi reliable FSK transceiver system. The operation frequency can cover 300 to 1000MHz.

RF12 supports a command interface to setup frequency, deviation, output power and also data rate. No need any hardware adjustment when using in frequency-hopping applications

RF12 can be used in applications such as remote control toys, wireless alarm, wireless sensor, wireless keyboard/mouse, home-automation and wireless data collection.

CLK signal is derive form crystal oscillator and it can be applied to MCU clock in to save a second crystal.

If not used, please set bit “dc” to disable CLK output

To integrate the load capacitor internal can not only save cost, but also adjust reference frequency by software

v4..v0: Set threshold voltage of Low battery detector:

$$V_{lb}=2.2+V*0.1 \text{ [V]}$$

This command starts with a 0 and be used to read internal status register

3. Demo flow diagram

Transmitter:

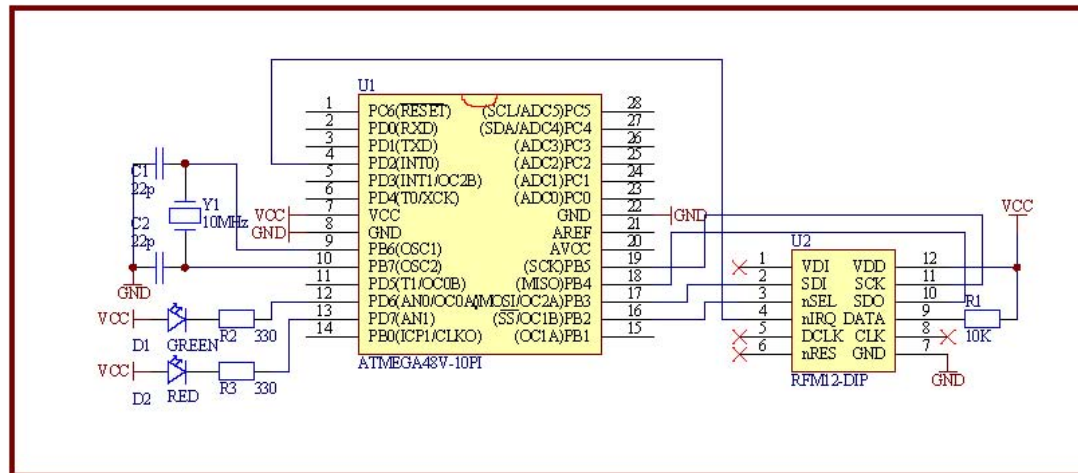

Note: Initialize RF12 and open transmitter, RF12 will transmit a byte and pull nIRQ low when transmit over, then MCU can write next byte to transmit

Receiver:

Note: After RF12 initialization, Open FIFO receive mode and wait nIRQ low, only then MCU can read received and stored in FIFO data. For next package receive, please reset FIFO.
